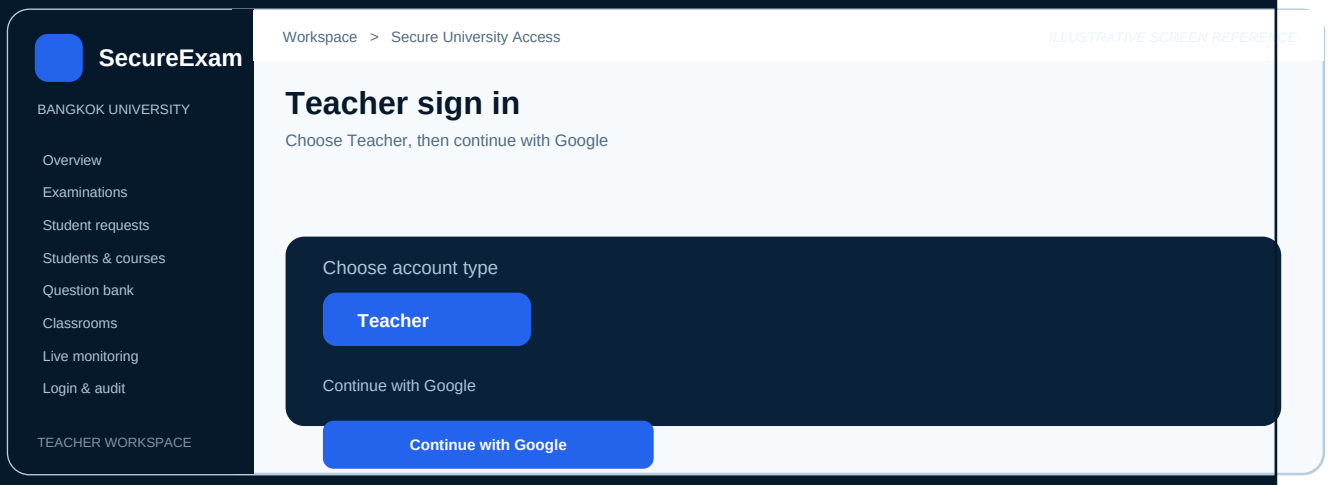
SECUREEXAM PRO | TEACHER GUIDE

Your courses.
Your exams.
Your teaching workspace.

A detailed, illustrated walkthrough for Adrian B.

Teacher sign-in: adrian.b@bu.ac.th



Before you start
Use the Google account **adrian.b@bu.ac.th**. Choose **Teacher**, then continue with Google. If this address was just approved, sign out of any existing session and sign in again so the teacher role refreshes. Google-only accounts do not use a separate SecureExam password.

Inside this guide

1. Sign in and understand your workspace
2. Create a course and enroll students
3. Build questions and format a paper with AI
4. Create, configure and publish an exam
5. Monitor the exam and respond to warnings
6. Approve student requests and review results
7. Troubleshooting and a ready-to-use checklist

1. Sign in and understand your workspace

SecureExam Pro opens a role-specific workspace. Your teacher account is for courses and assessments that you create and manage.

01

Open the sign-in page

Go to the SecureExam Pro website. If the page is already open, use the account menu to sign out first when switching accounts.

02

Choose Teacher

On the role selector, choose **Teacher**. This selects the teacher sign-in flow; it does not grant teacher access by itself.

03

Continue with Google

Select **Continue with Google**. Choose **adrian.b@bu.ac.th** and finish Google sign-in. If prompted to choose an account, make sure you do not select another saved account.

04

Check the workspace

After login, confirm the teacher navigation appears. You should be able to open Students & courses, Question bank, Examinations, Classrooms, Student requests, Live monitoring and Login & audit.

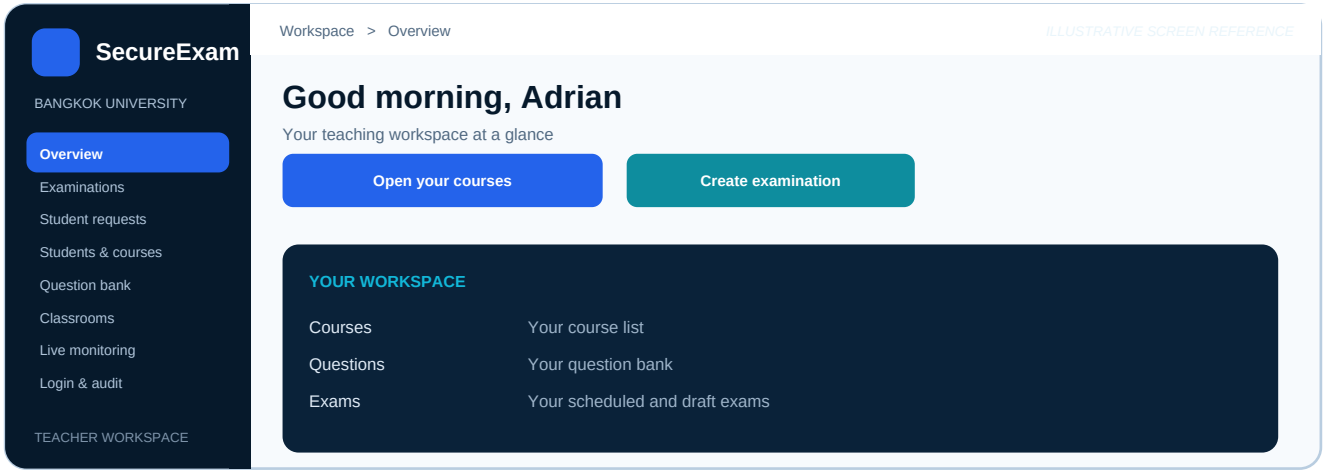


Figure 1. Example teacher workspace navigation. The picture is an illustrative guide image; course names and counts are examples.

What the main pages are for

Overview	A summary of your teaching workspace and current activity.
Students & courses	Create courses, view each roster, share enrollment QR codes and manage membership.
Question bank	Create reusable questions and review AI-formatted drafts.
Examinations	Create, configure, publish, monitor and manage exams tied to your courses.
Student requests	Review course-grouped requests for exam entry or re-entry.
Live monitoring / Login & audit	Review active attempts, recorded signals, warning history and available evidence.

Your data stays in your workspace
Your courses, rosters, question bank, exams and course activity are scoped to your teacher account. Other teachers do not get your course list. Students can participate in several teachers' courses, but a teacher sees a student through that teacher's own course enrollment.

2. Create a course and enroll students

Create your course first. New teachers type their own course details; they are not asked to choose a course from another teacher's catalog. The exam setup page later lets you select one of your own courses.

01

Open Students & courses

Choose **Students & courses** in the teacher navigation.

02

Start a new course

Select **New course**. Enter the course code, the full course name and the section. Example: **IBA214**, **Technology for Business**, **256C**. Section can be left blank if the course has no section.

03

Save and confirm

Choose **Save course**. Your new course should appear in your course list with its own enrollment count.

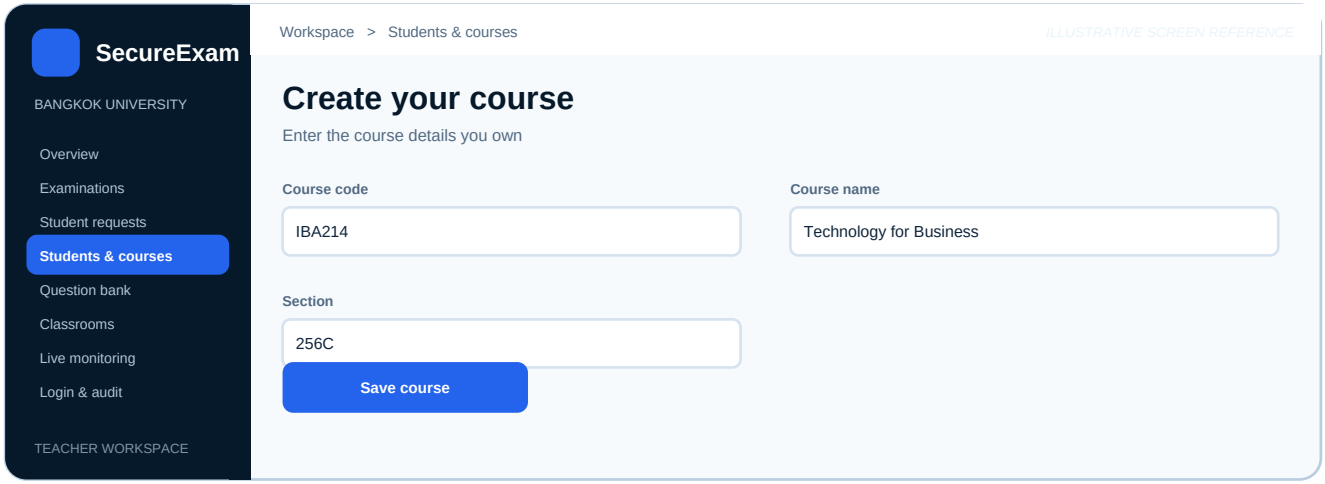

Figure 2. Example of the typed course form. Use the code, name and section assigned for your class.

Enroll students with a course QR code

04

Open the course QR

Find your course in the list and open its enrollment QR control. Display the QR in class or copy its link using the dialog.

05

Ask students to sign in first

Students should sign in with their approved student account, then scan/open the course QR. The QR enrolls a student in this one course.

06

Check the roster

Click the course card to open its roster. Confirm names and student IDs. You can enroll an existing student by email when they have already signed in once.

07

Remove a student if needed

Use **Remove from course** in that course roster. This removes their access to that course; it does not delete the student account.

Keep QR codes within your class
Anyone who obtains an active enrollment QR may be able to request enrollment for that course. Share it with your intended students and refresh/reissue it if you believe it was exposed.

3. Build questions and format a paper with AI

Questions added through the AI paper builder start as an editable draft for the current exam. They are not automatically saved to the shared question bank. Review every question and answer suggestion before adding the paper.

Option A: create reusable questions

01

Open Question bank

Select **New question**. Choose the question type, enter the prompt and marks, then complete options, solution and rubric as appropriate.

02

Save and review

Save the question and confirm it appears in your list. Use search to find questions later. Reusable questions remain in your teacher question bank.

Option B: format source material for an exam

03

Open a draft exam

Open the draft exam and go to its Questions tab. In **Make question paper with AI**, expand the builder if needed.

04

Load or paste the source

Choose an uploaded DOCX, searchable PDF or TXT file, or paste/edit the extracted text. The source limit is 30,000 characters. Image-only PDF pages can be uploaded for students but cannot be text-imported by the AI builder.

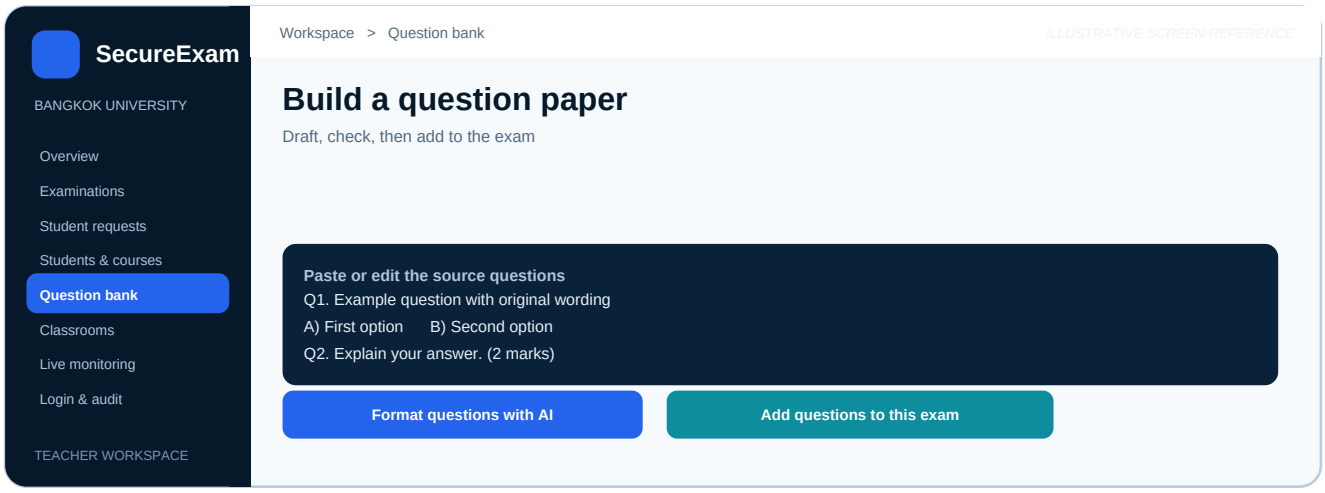

Figure 3. Example AI question builder and review controls. This is an illustrative reference.

05

Format the questions

Choose **Format questions with AI** and wait for the review cards. Clearly numbered items such as **Q1.**, **Question 2.** or **1.** help keep questions separated. Include section directions, answer choices and marks in the source text.

06

Review each draft carefully

Check the exact wording, order, question type, marks, options, answer key and rubric. AI suggestions can be wrong. Edit incorrect content and remove anything that should not be on the exam.

07

Add the draft paper

Choose **Add questions to this exam**. Confirm the questions appear in the exam paper. Save the exam after any manual edits.

If formatting fails

Check that the source contains readable text and is under the limit. Add clear question numbers and try again. If Ollama cannot format an unnumbered source, number the questions and retry; clearly numbered questions can be extracted from the source as an editable fallback. If the AI service is not configured, an administrator must enable it.

4. Create, configure and publish an exam

01

Create examination

Open **Examinations** and choose **Create examination**. Enter a clear title, then choose one of your own courses and sections.

02

Set the schedule

Enter the opening and closing time in your device timezone. Set the exam duration and passing score. Confirm the close time is after the open time and leave enough time for students to finish.

03

Choose any classroom

If location checking will be used, select a saved classroom. The system may suggest a room based on your location. Verify the selected room before saving. If no location check is needed, leave the classroom unset.

04

Set exam checks independently

Use **Choose student checks** to turn on the checks required for this exam. Camera, microphone, location, fullscreen, Ollama camera review, tab-change monitoring, teacher approval and entry code are distinct checks. Required screen sharing applies on laptops; it is not required on tablets.

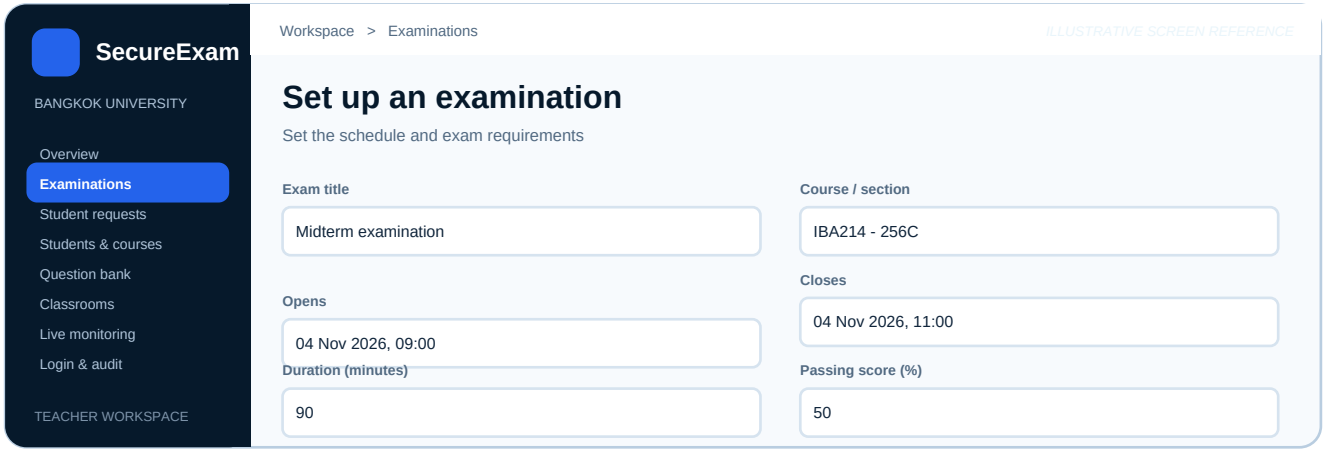

Figure 4. Example exam setup form with schedule, course and checks.

05

Write clear student instructions

State allowed materials, time limits, how to request help, submission requirements and any classroom code instructions. Avoid relying on students to infer rules from the checkboxes.

06

Add the question paper

Add existing questions from your question bank, use the AI paper builder, or upload supporting materials. For a question paper document, tell students whether they must also submit a completed file.

07

Save as draft and check

Review the title, course, times, duration, instructions, checks, classroom and every question. Save the draft before publishing.

08

Publish or schedule

Choose **Publish examination** after review. A published exam becomes available to enrolled students according to the schedule. Use the exam QR controls if students need a quick way to open or enroll, and keep it within the class.

Published exams
Published papers are treated as immutable. To make major changes, duplicate the exam and revise the draft copy. Check the status badge and start/end time on the exam page before class.

5. Monitor the exam and respond to warnings

During the exam, use the monitoring pages to understand current attempts and signals. A warning is a review signal, not a conclusion that misconduct occurred.

01

Open Live monitoring

Choose **Live monitoring**, then select the exam. Active attempts, answer progress, device checks and recent signals refresh during the session.

02

Open a student for details

Select a student to see the warning history and available evidence. Review the event time, reason, surrounding activity and any saved image before deciding what follow-up is appropriate.

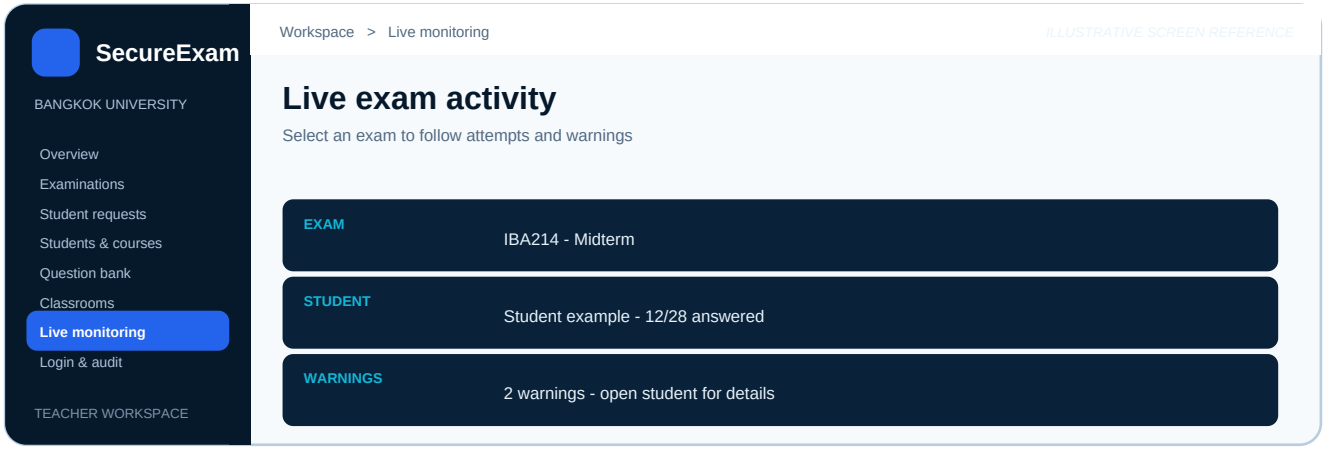

Figure 5. Example live monitoring and warning review view. Student details here are illustrative.

03

Check the evidence link

Use **View warning evidence** or the event evidence link when available. On Login & audit, warnings are grouped by exam, date and student. A Google Drive archive link appears when evidence has been archived successfully.

04

Retry Drive archiving if needed

If the warning group says no Drive archive link is available, choose **Save / refresh screenshots in Drive**. Check the result message. If it still fails, preserve the app evidence link and ask the administrator to check Drive configuration.

05

Record a review note

In Action center, open an unreviewed warning, inspect the evidence and enter a factual note. Reviewing does not erase a warning or change the student's exam answers.

06

Use evidence proportionately

Compare timestamps and surrounding context. Camera, microphone, network, location and tab signals may be incomplete or produce false positives; review them with the exam instructions and student context.

Evidence and storage
Warning screenshots or camera stills are available only when the event produced an evidence file and the storage integration is configured. A missing Google Drive link means archiving has not been confirmed. Do not assume every warning has a Drive image; verify the evidence status in the interface.

6. Approve student requests and review results

Student requests for exam entry or re-entry are reviewed separately from warnings. Check that each request belongs to your course and current exam before acting.

01

Open Student requests

Choose **Student requests**. Requests are grouped by course and include the student, exam and request time.

02

Review the request context

For an entry request, confirm the student and exam before approval. For a re-entry request, read the student's note and check the attempt status. Contact the student through your normal university channel if you need context.

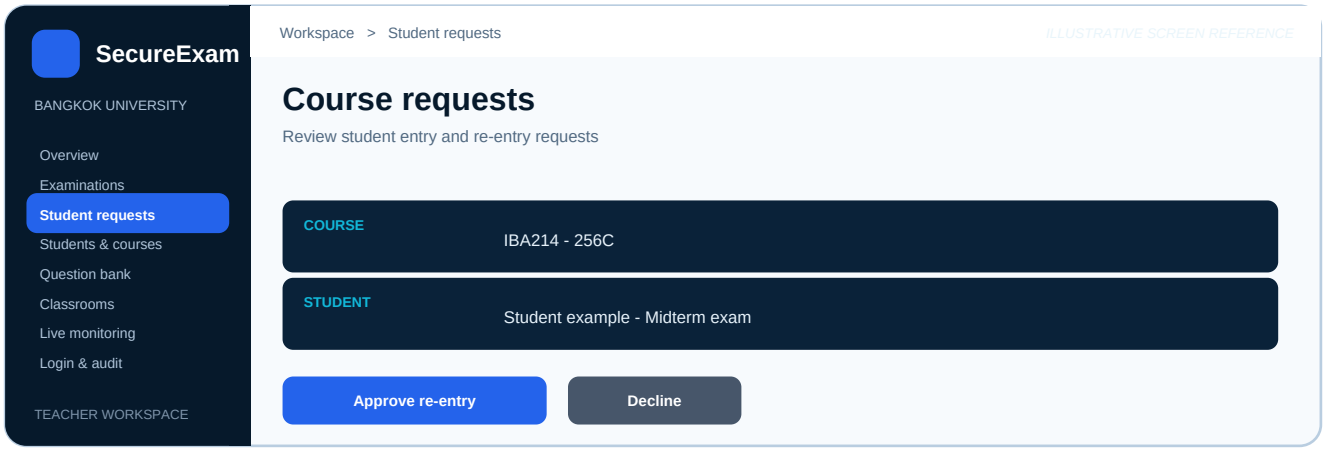

Figure 6. Example course request inbox with approve and decline actions.

03

Approve or decline

Choose **Approve entry** or **Approve re-entry** to let the student proceed. Choose **Decline** for a re-entry request when appropriate. The inbox refreshes after the action.

Review submissions and release grades

04

Open the exam reports

Use the exam page Reports tab or Exam submissions page to review submitted attempts. Confirm the student, exam and attempt before grading.

05

Grade and leave feedback

Review each response against your rubric. Save marks and feedback, then check totals and student identity.

06

Release results deliberately

Use **Release results** when you are ready for students to see grades and permitted feedback. Before release, verify the exam, scores, and feedback for the class.

07

Export or print when useful

Use CSV export for a spreadsheet workflow or Print / PDF for a printable record. Store exports according to university policy.

Keep decisions accountable
Use neutral, factual notes. Monitoring signals and AI summaries support instructor review; they do not replace your academic judgment or university procedures.

7. Troubleshooting and ready-to-use checklist

Common issues

What you see	Try this
Teacher sign-in returns to the student workspace.	Sign out, then sign in with Google using **adrian.b@bu.ac.th** and choose Teacher. Verify the Google account selected. If it continues, ask the administrator to confirm teacher access.
Course list is empty.	Create a course under Students & courses by typing code, name and section. Refresh the page after saving.
Students cannot find an exam.	Confirm they are enrolled in the course, the exam is published, the open time has arrived, and the student is signed into the correct account.
AI formatting returns an error.	Check the source is readable, below 30,000 characters, and has clear question boundaries. Try a text-exported PDF/DOCX or paste the text directly. Review any fallback extraction.
Classroom location is marked inaccurate.	Recheck the saved classroom coordinates and radius. GPS uncertainty can be high indoors; confirm room settings with the administrator rather than approving a mismatched location blindly.
Warning has no Drive link.	Open Login & audit and try Save / refresh screenshots in Drive. If it fails, send the administrator the event timestamp and error message so Drive access can be checked.
Student asks to rejoin.	Open Student requests, verify the course and exam, read the request, then approve or decline re-entry.

Before exam day: instructor checklist

01 **Sign in to the correct Google account and confirm the teacher workspace.**

02 **Create the course, check the section and confirm the roster.**

03 **Open the exam as a student preview if available; verify time, instructions and question layout.**

04 **Check every question, option, answer key, mark and rubric; correct all AI suggestions.**

05 **Confirm the exam is published with the right course, opening time, closing time and duration.**

06 **Select only the device checks needed and make sure classroom location settings are correct.**

07 **Test Drive evidence archiving with an authorized test event before relying on it for a real exam.**

08 **Know where to find Student requests, Live monitoring, Login & audit and Exam submissions.**

Support
For account access, course ownership, AI service or Google Drive storage issues, contact the SecureExam Pro workspace administrator. Include the page name, exam title, time of the issue and exact error text. Never send your Google password.
